PAC-DENT

ProMate CL and AntiSplatr

When it comes to polishing patients' teeth, the synergy between a clinician's hygiene handpiece and their prophylaxis angles is crucial for performing effective and efficient procedures—ensuring both clinician and patient comfort while delivering exceptional results.

This is where Pac-Dent's ProMate CL Cordless Hygiene Handpiece and AntiSplatr Flex Disposable Prophylaxis Angles excel. The ProMate CL's powerful, ergonomic design offers clinicians improved comfort and control, while the AntiSplatr prophylaxis angles feature cutting-edge technology aimed at enhancing safety and polishing. Together, they form an extraordinary pair for prophylaxis care.

Cordless Freedom and Flexibility

With ultralight construction, the ProMate CL weighs just 3.8 oz, which is 20% lighter than other leading low-speed handpieces. It is optimally balanced to maximize user comfort, and its cordless

functionality improves mobility, visualization, and access—all without having to drag or pull cords during treatments.

The handpiece's dual-mode speed control with 6 speed settings blends power with a user-friendly design, including a quick-touch on/off button; a wireless, Bluetooth-connected foot pedal; and a long battery life that easily lasts through an entire day of procedures. The ProMate CL also provides clinicians with the flexibility to use their preferred brand of disposable prophylaxis angles.

A CDC-compliant and steam autoclavable outer sheath facilitates sterilization and infection control protocols, and a disposable polyethylene barrier is available to cover the ProMate CL handpiece.

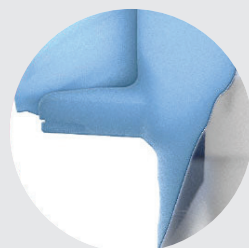

Enhanced Polishing and Protection

The AntiSplatr Flex Slim and Flex Ergo Slim prophylaxis angles enhance polishing with the flex cup, which adapts to the contours of any tooth, reduces excessive wrist movement, improves overall comfort, and optimizes paste spread and retention. An upgraded cup lip and flare also provide superior access to subgingival areas, and external ridges facilitate interproximal polishing.

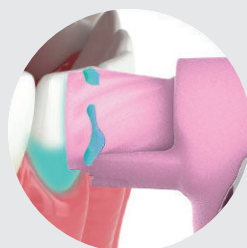

The prophylaxis angles feature a 42% smaller body for improved access and visibility. Each angle includes Pac-Dent's renowned AntiSplatr fender, effectively preventing saliva, blood, and prophylaxis paste from accumulating on the cup's exterior.
