

## REDEFINING POLISHING

How AntiSplatr flex slim enhances comfort, control, and infection prevention.

In modern dentistry, infection control and ergonomic efficiency have never been more critical. The lessons learned from the COVID-19 pandemic continue to influence how dental professionals approach daily procedures, particularly those involving aerosol-generating procedures such as polishing. In response to these growing concerns, Pac-Dent has once again delivered innovation with the AntiSplatr Flex Slim, a latex-free disposable prophylaxis angle designed to elevate safety, comfort, and clinical performance.

## A SMARTER APPROACH TO SPLATTER CONTROL

A standout feature of the AntiSplatr Flex Slim is its integrated AntiSplatr splatter fender, engineered to prevent the accumulation of saliva, blood, and prophylaxis paste on the exterior of the prophylaxis cup. By minimizing splatter during polishing, this fender plays a crucial role in reducing cross-contamination risks, creating a safer environment for both dental professionals and patients. The fender's compact size and optimal positioning offer enhanced reach and visibility, especially in hard-to-access areas.

Unlike traditional prophylaxis angles, the Flex Slim doesn't rely on bulky attachments or workaround techniques to manage splatter — it incorporates preventive design directly into the product.

## FLEX CUP FOR FULL-SURFACE ADAPTATION

The flex cup of the AntiSplatr Flex Slim adapts seamlessly to the natural curves of the tooth, allowing smooth transitions across surfaces and consistent contact during polishing. The adaptive flare and pivot-inspired flexibility of the cup ensure easy access to subgingival

and interproximal areas while minimizing effort. Whether polishing flat surfaces or navigating tight contacts, the AntiSplatr Flex Slim maintains steady, controlled movement that reduces fatigue while improving coverage.

Additionally, the flex cup's design minimizes slippage and helps maintain consistent paste spread and retention, leading to more effective polishing with less mess.

## SLIMMER PROFILE, BETTER ACCESS

One of the most notable physical improvements in the AntiSplatr Flex Slim is its 42% smaller body and neck, which makes a real difference in tight or hard-to-reach areas. With improved maneuverability and a slim profile, dental professionals can polish with better visibility and fewer adjustments. The upgraded cup lip and flare further enhance subgingival access, while the external ridges contribute to more effective interproximal cleaning.

This thoughtful combination of design features enables the Flex Slim to deliver high-performance results in even the most challenging clinical conditions.

## ERGONOMIC COMFORT THAT LASTS

Dental professionals often experience chronic strain and fatigue from repetitive motions and awkward working angles. The Ergo configuration of the AntiSplatr Flex Slim directly addresses this issue by reducing microtraumas and improving overall hand comfort during procedures. With a more ergonomic grip and reduced stress on the wrist and fingers, practitioners can work more efficiently and comfortably throughout the day.

## DESIGNED FOR TODAY'S DENTISTRY

The AntiSplatr Flex Slim brings together splatter control, ergonomic comfort, and clinical precision in one reliable tool. It's designed with the evolving needs of modern dental professionals in mind — offering smarter infection prevention, better access, and long-lasting comfort. ■
